- We are concerned that low quality imputed genotypes may not work for family based analysis.
- There are some papers that even made headlines in news that used low quality imputed SNPs.
- E.g.: Howe et.al (2022) Sib-GWAS paper used low quality imputed SNPs in its analysis.
- Initially, I was focused only on the imputed data. I extended one of the Tammy's analysis to the whole genome.

- There are these family-based research designs like what we have in the within-family project that rely on special properties of family data.
- E.g.: random assignment of genotypes within families.
- Howe et.al. (2022) used the genetic differences between sibs.

Motivation

The Impact of
Imputation
Quality
on Family
Based
Analysis

Introduction

Correlation
Analysis

Correlation
Analysis
Conditional on
IBD states

WGS Data &
UKB RAP

- Based on the Mendelian laws we expect that the correlation between parent-offspring and sibling pairs to be 0.5.
- One way to detect issues in the imputed data is that if the correlation between sibling pairs and parent-offspring pairs deviates from 0.5.
- Assume i and j to be either siblings pairs or parent-offspring pairs, then theoretically we have:

$$\text{Corr}(G_i, G_j) = 0.5$$

- But the question is:

$$\text{Corr}(\hat{G}_i, \hat{G}_j) \stackrel{?}{=} 0.5$$

Correlation Analysis on the Imputed Data

Analysis

Correlation
Analysis
Conditional on
IBD states

WGS Data &
UKB RAP

- In theory, we should see 0.5 correlation between both full-sibling and parent-offspring pairs genotypes.
- So if the imputed genotypes is high quality imputed then we should see the distribution of correlations to be concentrated around the half.
- Expectation: we would expect more deviation for low quality SNPs from the theoretical expectation.

WGS Data &
UKB RAP

- UKB Imputed Data.
- We have a sample of $\simeq 20,000$ of sibling pairs.
- $\simeq 4000$ parent-offspring pairs.
- For each info score we selected 1000 SNPs randomly from the entire genome.

What is Info Score?

The Impact of
Imputation

Analysis
Conditional on
IBD states

WGS Data &
UKB RAP

- For each imputed SNP we have an info score between zero and one which gives us the quality of imputation.
- If it is closer to 1 the higher the quality of imputation is and the more we are confident that the imputation is close to reality.
- And the more it is closer to 0 we are less confident that is true.

$$\forall \text{ Imputed SNP} : 0 < \text{Info Score} < 1$$

Dosages vs. Hard-Calls Genotypes

- Imputation methods gives us for each SNP a discrete probability distribution.
- If we get the expectation of those probabilities we call it dosages.

$$\text{Dosages} = \mathbb{E}(\hat{G}) = 0 \times P[G = 0] + 1 \times P[G = 1] + 2 \times P[G = 2]$$

- If we just pick the most probable genotype then we have the hard-call for the SNP.

$$\text{Hard-Call} = \underset{G \in \{0,1,2\}}{\operatorname{argmax}} P(G)$$

- What if we calculate all these correlations conditional on IBD states?
- Conditioning on IBD states for parent-offspring pairs doesn't mean anything because they are always $IBD = 1$ so we would get the same results as before when we didn't condition on IBD states.
- Suppose i and j are siblings. Then in theory we have

$$\text{Corr}(G_i, G_j | IBD = 0) = 0$$

$$\text{Corr}(G_i, G_j | IBD = 1) = 0.5$$

$$\text{Corr}(G_i, G_j | IBD = 2) = 1$$

- UKB has released whole genome sequencing (WGS) data on 30th November 2023 from half a million volunteers.
- First they released 200K version in 2021.

**Whole genome
sequencing for
500,000
participants has
generated 27.5
petabytes of data!**

UKB-RAP Setup

Based
Analysis

Introduction

Correlation
Analysis

Correlation
Analysis
Conditional on
IBD states

WGS Data &
UKB RAP

- First you create an account get approved on UKB-AMS.
- Then you should be added as a part of SSGAC on the platform.
- Then using your account you can access the RAP-Platform.
- On the RAP platform you have access to different tools like Jupyterlab & R studio.
- You should first create a project then you can access tools & data.
- Upon project creation you should provide your application ID to access the data.

How to access WGS Data

The Impact of
Imputation
Quality
on Family
Based
Analysis

Introduction

Correlation
Analysis

Correlation
Analysis
Conditional on
IBD states

WGS Data &
UKB RAP

- Getting an application ID is a separate process in which you should apply to get access to the data and you should specify which data and for what purpose you want to use. It takes some days to get approved.
- But fortunately you don't need to do this.
- Get the application ID from Chelsea. If you are already a member of the SSGAC on the RAP you can use the application ID on your personal profile to get access to WGS data.
- You provide the application ID and you should select data bundles you need.
- Tabular data and bulk data files
- Additional bulk data files for individual level data later. It takes about 1 or 2 days to dispense data to your project.

Some Important Things

WGS Data &
UKB RAP

- Billing: I am using the the £40 to get an estimation then I would transfer billing to SSGAC.
- WGS Individual level data is in this path:
yourproject:/Bulk/DRAGEN WGS/Whole genome variant call files (VCFs) (DRAGEN) [500k release]/10/
- Will PLINK or BGEN versions be released?
PLINK 2.0 and BGEN versions for both the DRAGEN and GraphTyper joint variant calls are planned to be released in 2024.
- CAUTION: Individual IDs are getting randomized for each application ID. You might get results that are completely random if you don't know this.

WGS Data &
UKB RAP

- We are going to estimate a sib-difference regression on the real WGS data then we can ask what we would obtain if we instead use imputed data.
- Then we can assess the bias that comes from using imputed data.
